

Android, installing WPS filtering certificate

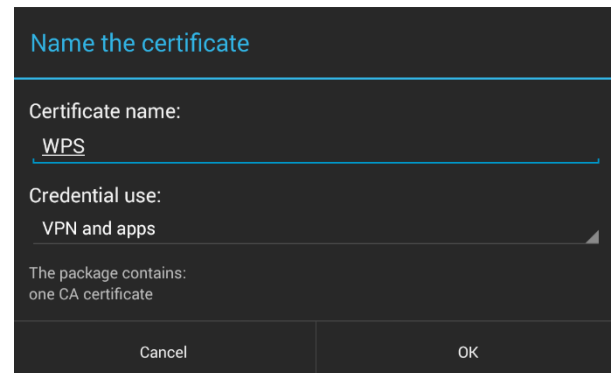

Click Install Certificate button

Install Certificate

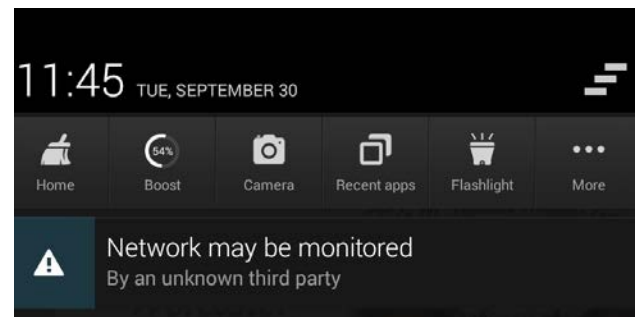

A window will open asking for the name to give the certificate

Type in WPS for the name and press OK. Leave the default of VPN and Apps as the default for Credential Use and press OK. You may be prompted to add a PIN code or passcode for extra security. You will be required to enter this PIN code every time you wake up your Android device so do not forget your PIN.

Android will now warn you that your "Network may be monitored by an unknown third party." This appears now because the WPS certificate allows the WPS filter to exam traffic going to the Internet while on the WPS WiFi only.

You are done.
